

Latency Reduction Examples

Latency

- Depends on multiple factors:
 - application's design and performance,
 - monitor's specification (variable or fixed refresh rate),
 - software settings (e.g. VSync).
- Metrics:
 - Input-to-render
 - Delay between application's input sampling and rendering start on a GPU.
 - Render-to-screen
 - Delay between a finish of GPU rendering and actual presentation on a screen.
 - **Input-to-screen**
 - Time between input sampling and frame presentation on a screen.
- Tools
 - GpuView can be used to analyze application's latency and find bottlenecks.

Render queue – no latency reduction

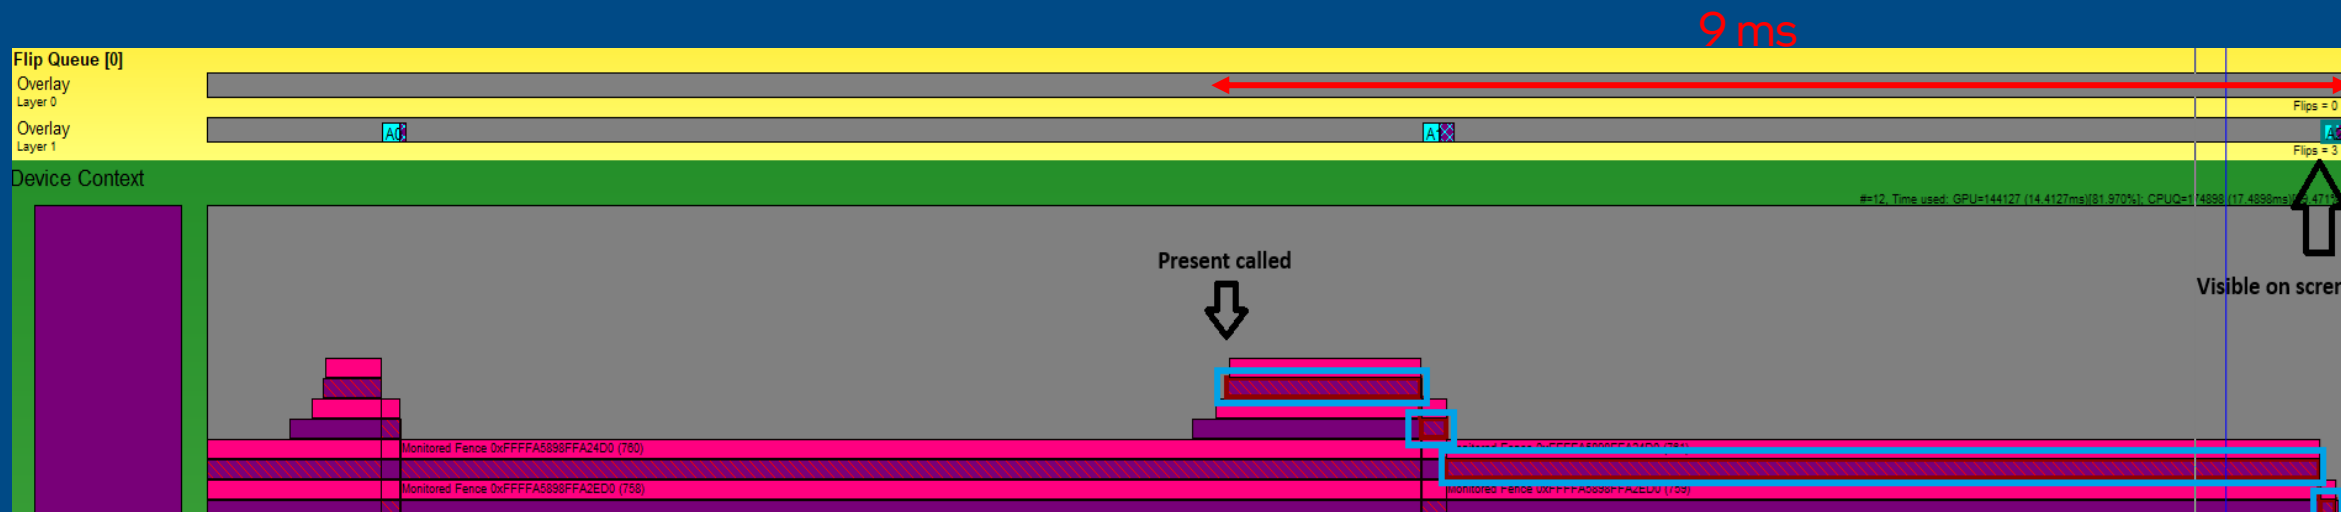

- Multiple frames in the queue
 - Two previous frames shown in between Present call and actual presentation start
- Not related to Display configuration and mode
- Causes input lag due to prematurely sampled input from the user
 - GPU can't process the frame yet due to previous frames being in the queue
- Present packet spent 19 ms in a queue

60Hz FRR monitor, VSync disabled

Render queue – latency reduction

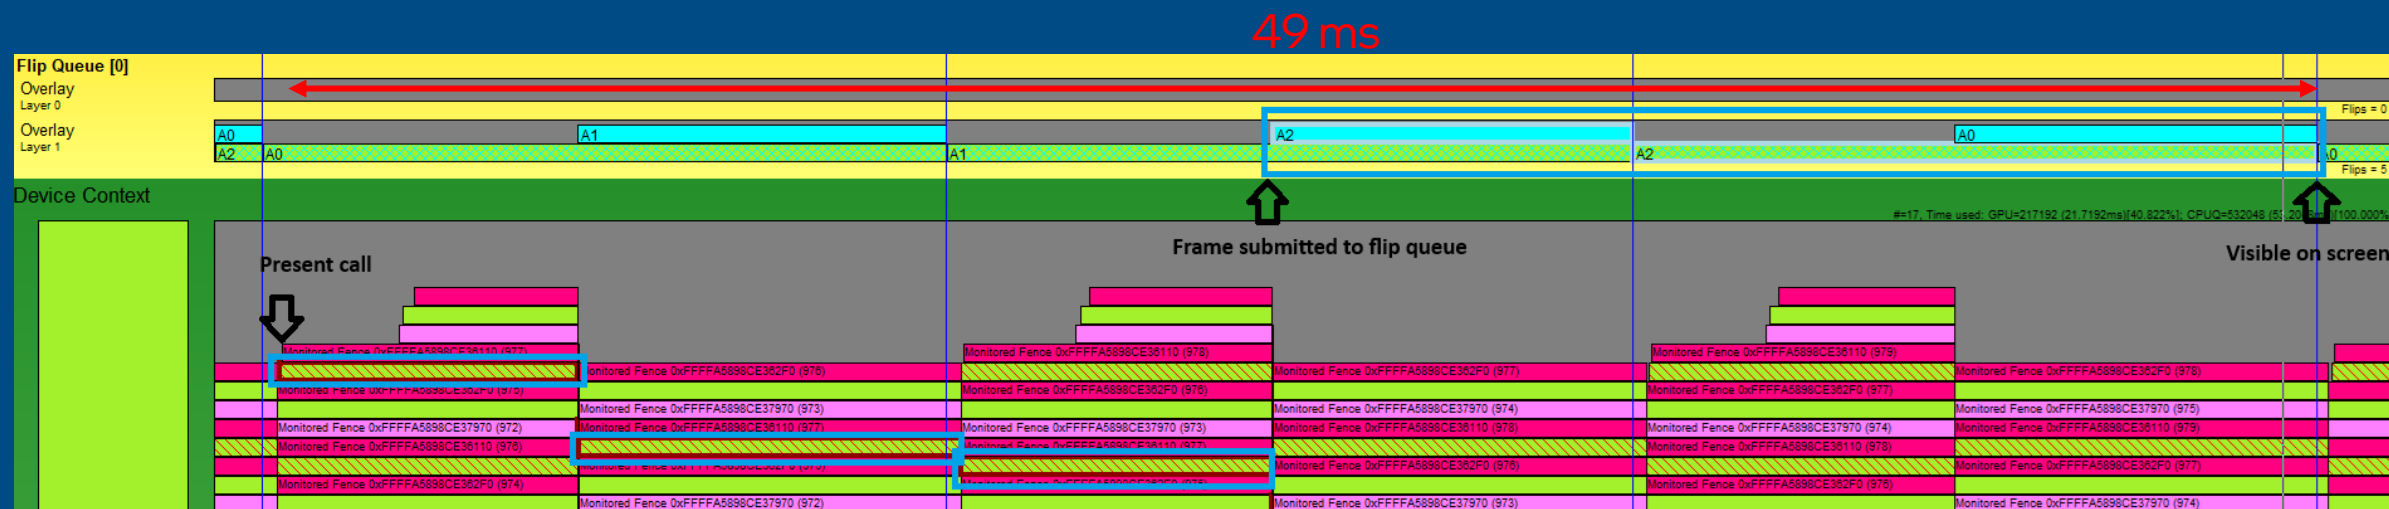

- Frames are submitted around a time when previous frame finishes execution on a GPU
- Present packet spent 9 ms in a queue (over 50% reduction)
- GPU utilization not affected

60Hz FRR monitor, VSync disabled

Display optimizations

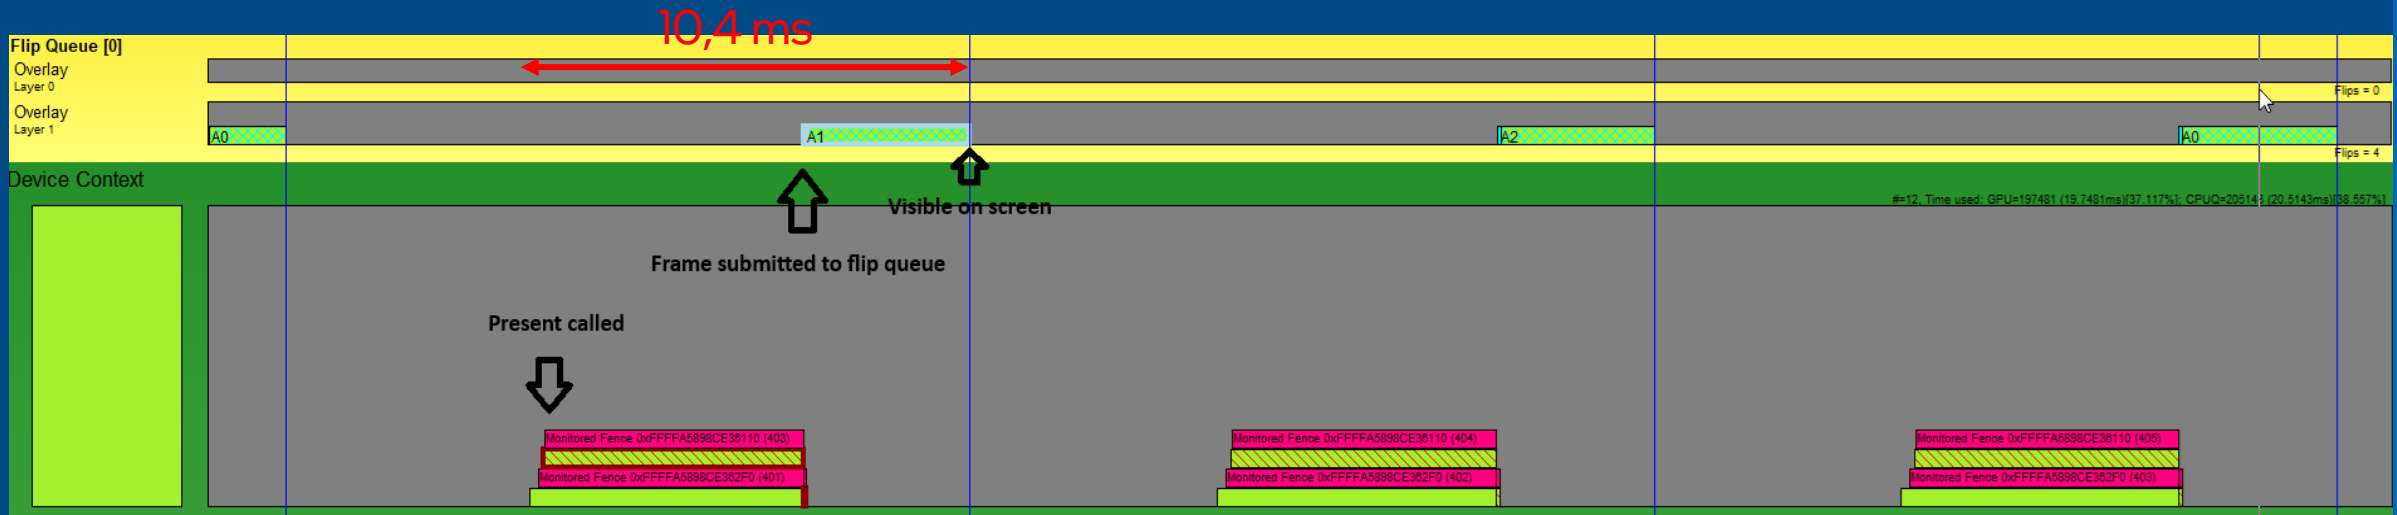

- Available in "No tearing" (aka "VSync ON") display modes
- 49 ms from Present submission until actual presentation
- Delay caused by Render Queue and Flip Queue

60Hz FRR monitor, VSync enabled

Display optimizations

- Possible if performance is sufficient (FPS \geq display refresh rate)
- 10.4 ms from Present submission until actual presentation
- Render queue is also reduced
 - Gaps created due to V-Sync FPS limit do not affect performance
- No Input-to-render latency
- Render-to-screen minimized

60Hz FRR monitor, VSync enabled

Frame limiter and latency reduction

- 60 Hz display, VSync on
- Frame limiter set to 30 FPS
 - Means 1 frame every other Vsync period
- Frame cap interval is aligned with Vsync intervals

Latency reduction on, minimal input-to-screen time

Latency reduction off, frames are ready too early, present packets wait in a flip queue

The Intel logo is centered on a solid blue background. It features the word "intel" in a white, lowercase, sans-serif font. A small, light blue square is positioned above the first vertical stroke of the letter 'i'. To the right of the word "intel" is a small white registered trademark symbol (®).
